

Phase 2 Project

Box Office Films

// FLATIRON SCHOOL

Agenda

- Project Prompt
- Project Deliverables
- Schedule

Project Prompt

Project Prompt

You are charged to explore the data to find what makes a movie successful

Provide 3 concrete recommendations to a “new” movie studio on what films to produce

Utilize Simple Linear Regression to quantify a numeric response variable relationship (revenue, ROI, budget, etc...)

Project Deliverables

DS Process: CRISP-DM

Consider the **CRISP-DM** process and headers while creating each deliverable.

Modeling:

1. Statistical Tests
2. Simple Linear Regression

Project Deliverables

**Non-Technical
Presentation**

**GitHub
Repository**

**Jupyter
Notebook**

**Tableau:
Don't forget me!**

Non-Technical Presentation

- Slide deck for a **five minute** presentation
- **Non-technical audience**
- Professional style
 - Light on text
 - Effective template
 - Legible and labeled visualizations

[Example slide deck](#)

Non-Technical Presentation

Tell a Story:

Beginning

- Overview
- Business Understanding
- Stakeholder
- Key Business Questions

Middle

- Data Understanding
- Visuals from EDA
- **Final Model Results (non-technically!)**

End

- Recommendations
- Next Steps
- Thank You Slide

GitHub Repository

- Where your project lives and grows - want to see a consistent commit history throughout
- **This will be part of your portfolio at the end of this course!**
- Recommend **starting your repository from scratch** rather than forking the template repository

[Example repository and templates](#)

GitHub Repository

Must-Haves

1. **README.md**
 - More detail on the next slide
2. **Commit History**
 - Commit history with clear messages
 - Contributions throughout the project period
3. **Organization**
 - Clear folder structure
 - Clear naming conventions for files and folders
 - Technical notebooks and presentation file are easily located
4. **Notebook**
 - Final technical notebook on main level of repo
 - Working notebooks (if applicable) in subfolders
5. **.gitignore**
 - Ignores large files as well as junk files
 - [GitHub's python .gitignore template](#)
 - **PRO TIP: Add the unzipped sql database file to your .gitignore immediately**

GitHub Repository

README Sections

Your README should act as a **high-level technical summary**

- **General Overview**
- **Business Understanding**
 - Include stakeholder and business questions
- **Data Understanding**
 - Source of data (either describe or link)
 - Description of data (high level, go into more detail in your technical notebook)
- **Modeling**
 - Describe techniques or methods
 - Written interpretation of results (final model)
- **Conclusion**
 - Summary of conclusions / recommendations
- **Repository File Structure**
 - (nice-to-have not need-to-have)

Jupyter Notebook

- Blends code, markdown, and visualizations to tell the **full story** of your project (content may overlap with your non-technical presentation and README)
- Includes **justifications and rationale** for every decision made throughout the project
- Notebook should be free of errors and run from top to bottom
- Use CRISP-DM steps as markdown headers to divide your final notebook into **sections**

Important Links

- **Project Description**
 - Explains the project goal, dataset, and deliverables
 - Contains rubric explanations
- **Checklist Overview**
 - Use to check off requirements
- **Submission and Review Instructions**
 - Github URL
 - 3 PDFs
 - i. Repository main page
 - ii. Main notebook
 - iii. Presentation

Groups

- TBD

Steps to Get Started

Read Project Description

First Things First

1. Create github repo
2. Add group members as collaborators
3. Separate branches & notebooks

Plan Ahead

- Set group meet times
- Strategy for pull requests/git
- Utilize project 'board' if desired: [Notion](#), [Trello](#), or [Monday](#)

Think Data

- Master 'cleaned' dataset
- Might not be able to use all data files
- Joins, merges, etc
- Metric of choice

Gitflow for Branching Work

(Avoid merge conflicts)
